Energy:
How do we move and what will
move us in the future?

Prof. Thorsteinn I. Sigfusson

General Director of Innovation Centre Iceland

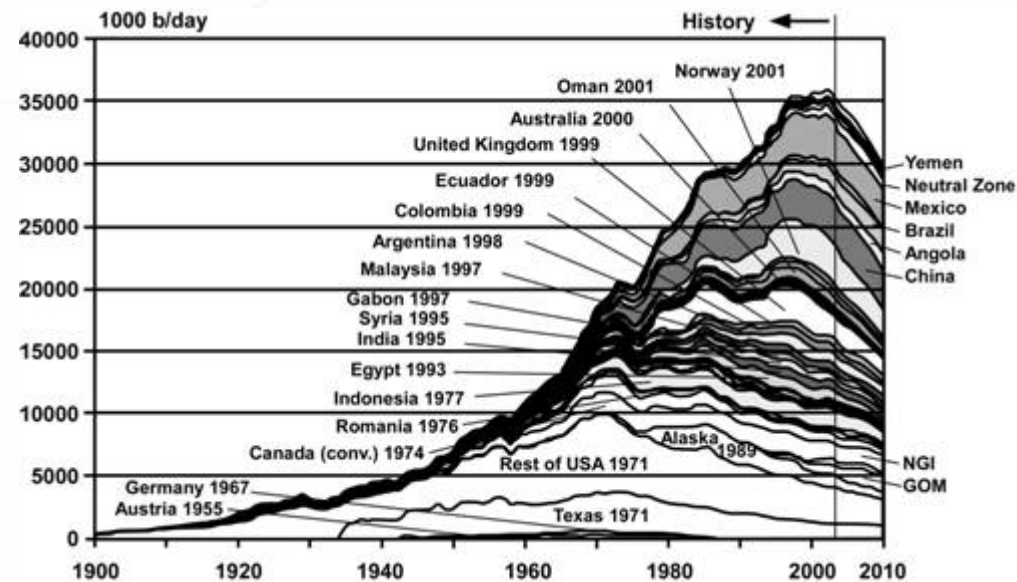

this@nmi.is

Innovation Centre
Iceland

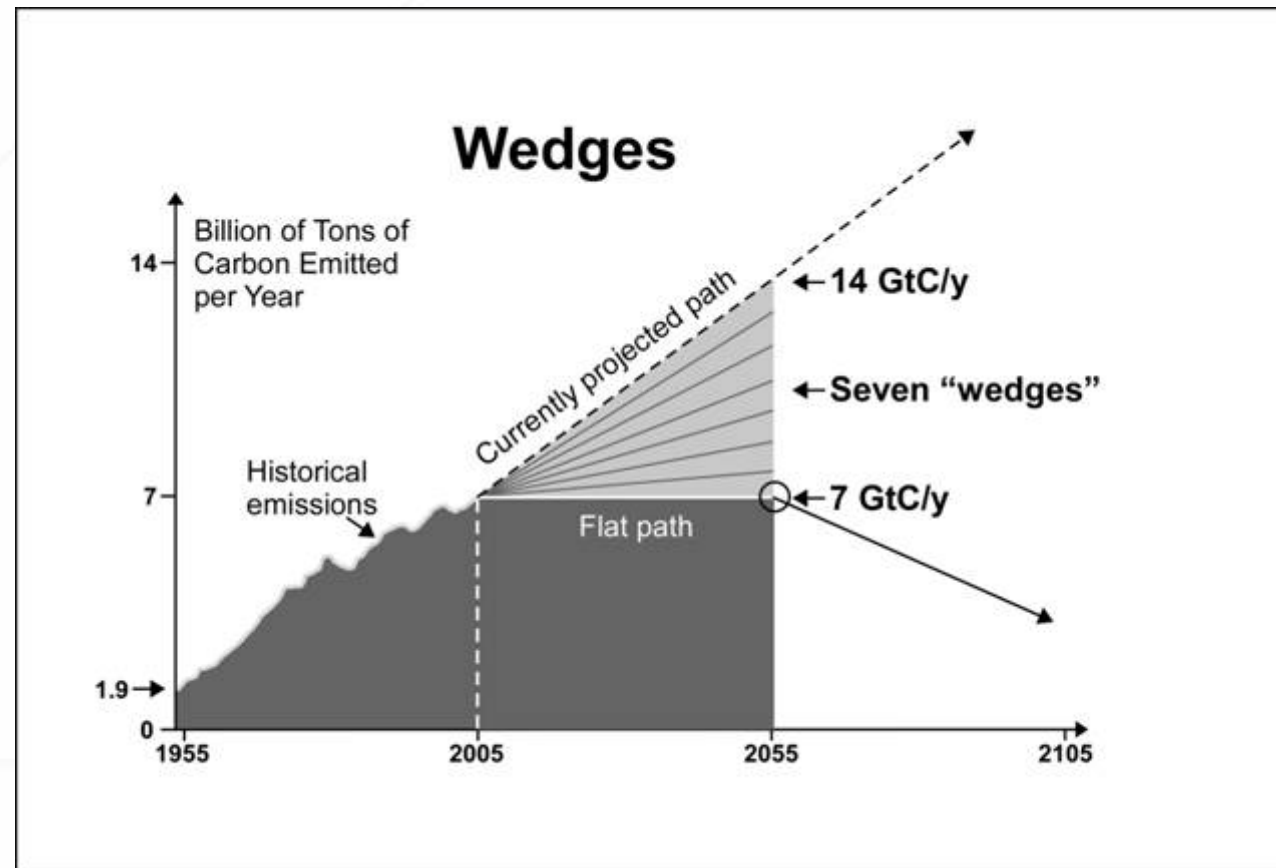

Energy is at crossroads: End of cheap oil

Price of a barrel of oil is increasing alarmingly as the world accepts the finiteness of oil and other hydrocarbons on Earth. If business proceeds as usual, we may expect doubling of CO₂ in atmosphere before 2058

Climate change calls for decarbonization.

The world is also at the crossroads where the Carnot-era of combustion technology is being replaced by the Gibbs Free Energy era of fuel cells

Increased efficiency is a keyword

- Gas replacing coal in power production
- Co-firing in power production
- Hybrid drivetrains in automobiles
- Biofuels replacing hydrocarbons
- Designer fuels from CO₂ and H₂
- New generation of cars:

The car of the future is going to be powered by electricity

- And there are various options of storing the energy needed: Let us take a look at one of them!

Ford Nucleon: powered by a Uranium pin lasting 10.000 kilometres – slightly radioactive! Invented in 1950's. Never built. The mock-up of the car can be viewed at the Henry Ford Museum in Dearborn, Michigan

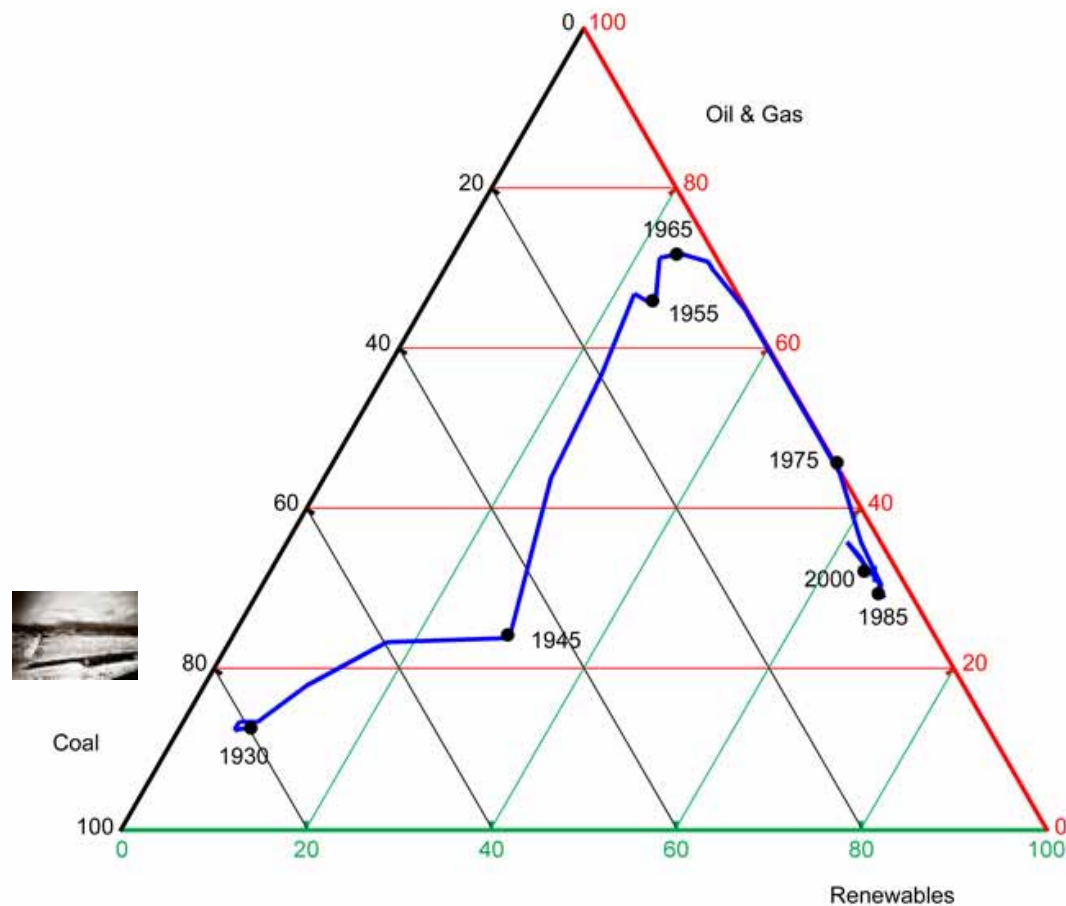

Other possibilities of non-fossil energy carriers:

- Biofuels (from renewable forests)
- Biofuels (competing with food) 
- Methanol (problems with emissions) 
- Hydrogen from renewables and water – which is believed to be the ultimate fuel but has proven difficult to tame

There is still a problem with the needed amounts of renewables

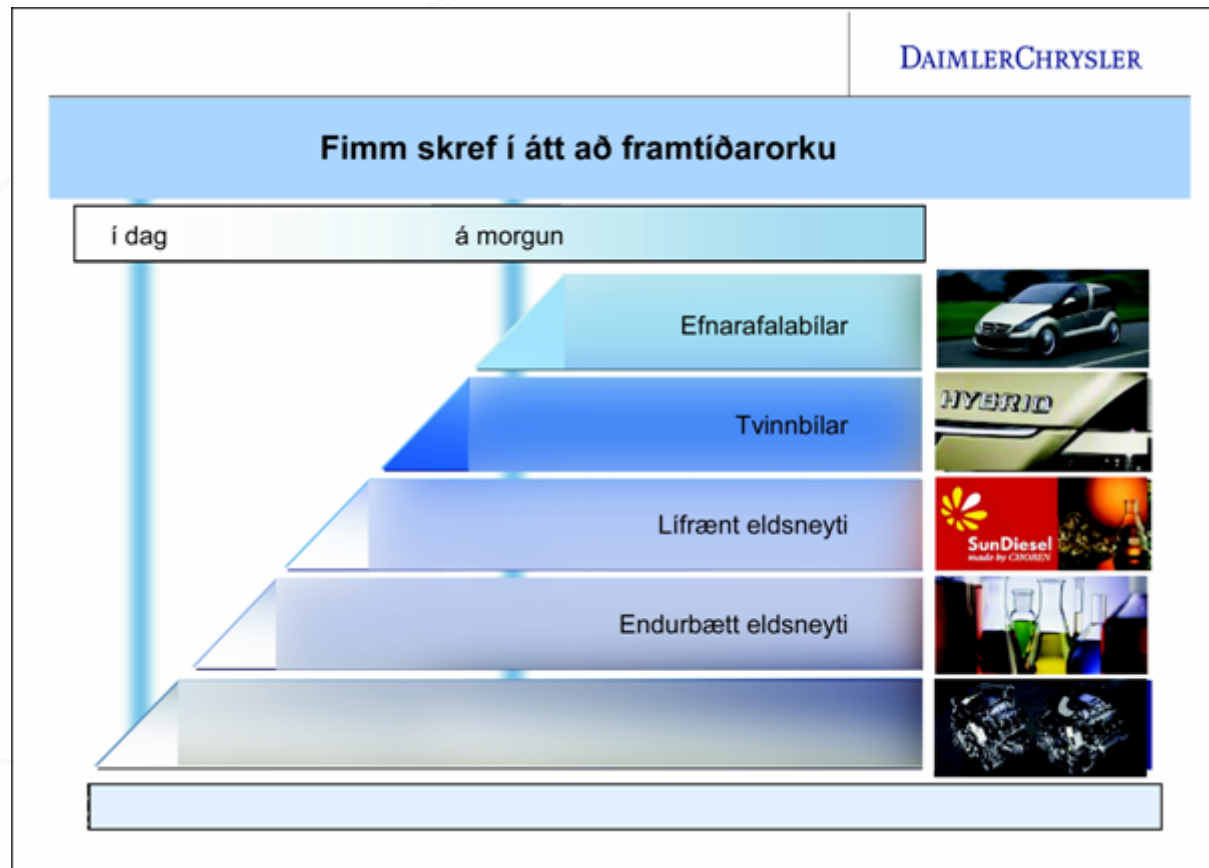

The primary energy sources in Iceland from 1930 - seen as a three component diagram: Coal, oil/gas, renewables

Iceland is currently 72% renewable energy based – the highest ratio in the world!

Iceland has teamed up with Daimler, Shell and Hydro

Unique Icelandic New Energy structure / objective

*H₂ and fuel cell
vehicle development*

Taming the proton is a big challenge. Storing Hydrogen can be tough, the fuel cells are still on the expensive side and efficiencies of production must be raised

Solid state storage

Iceland has currently the highest proportion of renewables in its energy portfolio: 80%

- The aim is to make them account for 100% by tackling transport system and fishing boats

Currently Reykjavik has a fleet of 14 hydrogen cars on the roads and a fueling station

The relatively simple ringroad around Iceland measures appr. 1400 km

Ten stations would create a customer acceptable minimum

The ECTOS-hydrogen station, open from April 24th 2003

Infrastructure

Old

New

The first dispenser had communication problems with the vehicles

We had problems of getting up to 350 bars

The Norsk Hydro team developed a new dispenser, installed in Iceland for testing

Since then:

<10 minute refuelling
problem free operation

Infrastructure Scenarios – Overview

The Capital area

On-site

Truck distribution

Pipeline distribution

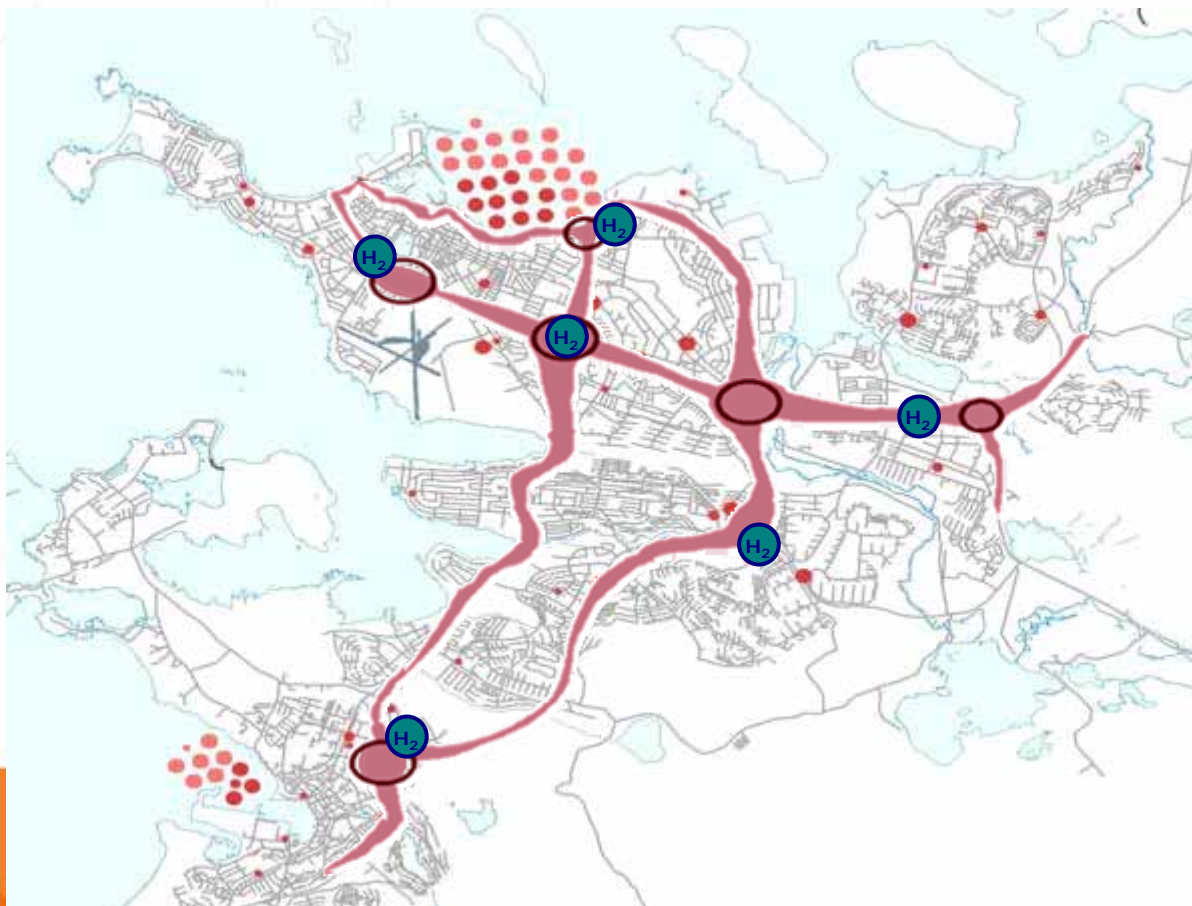

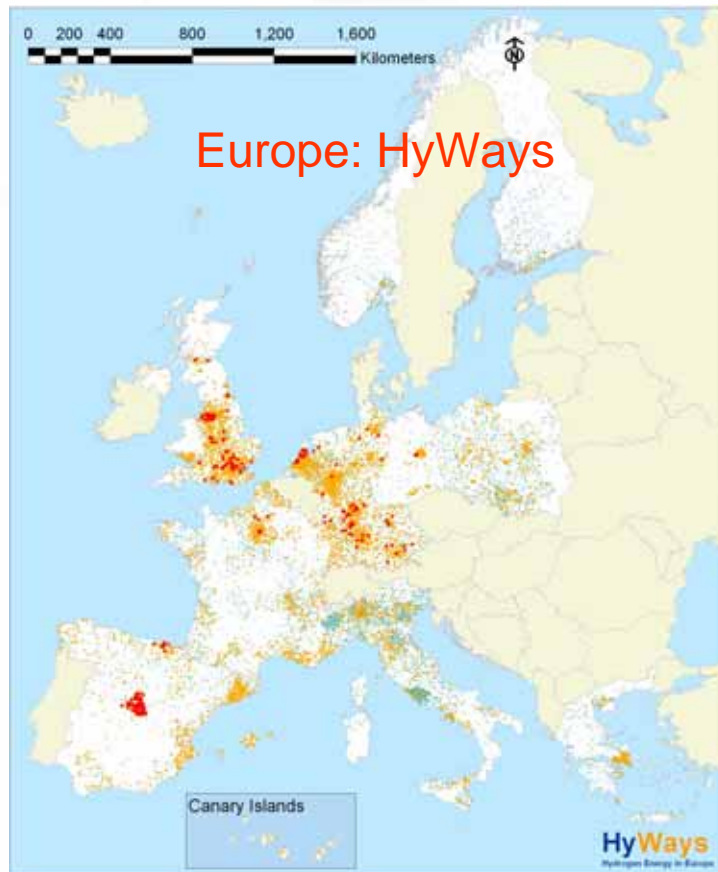

Initial Infrastructure Suggestion

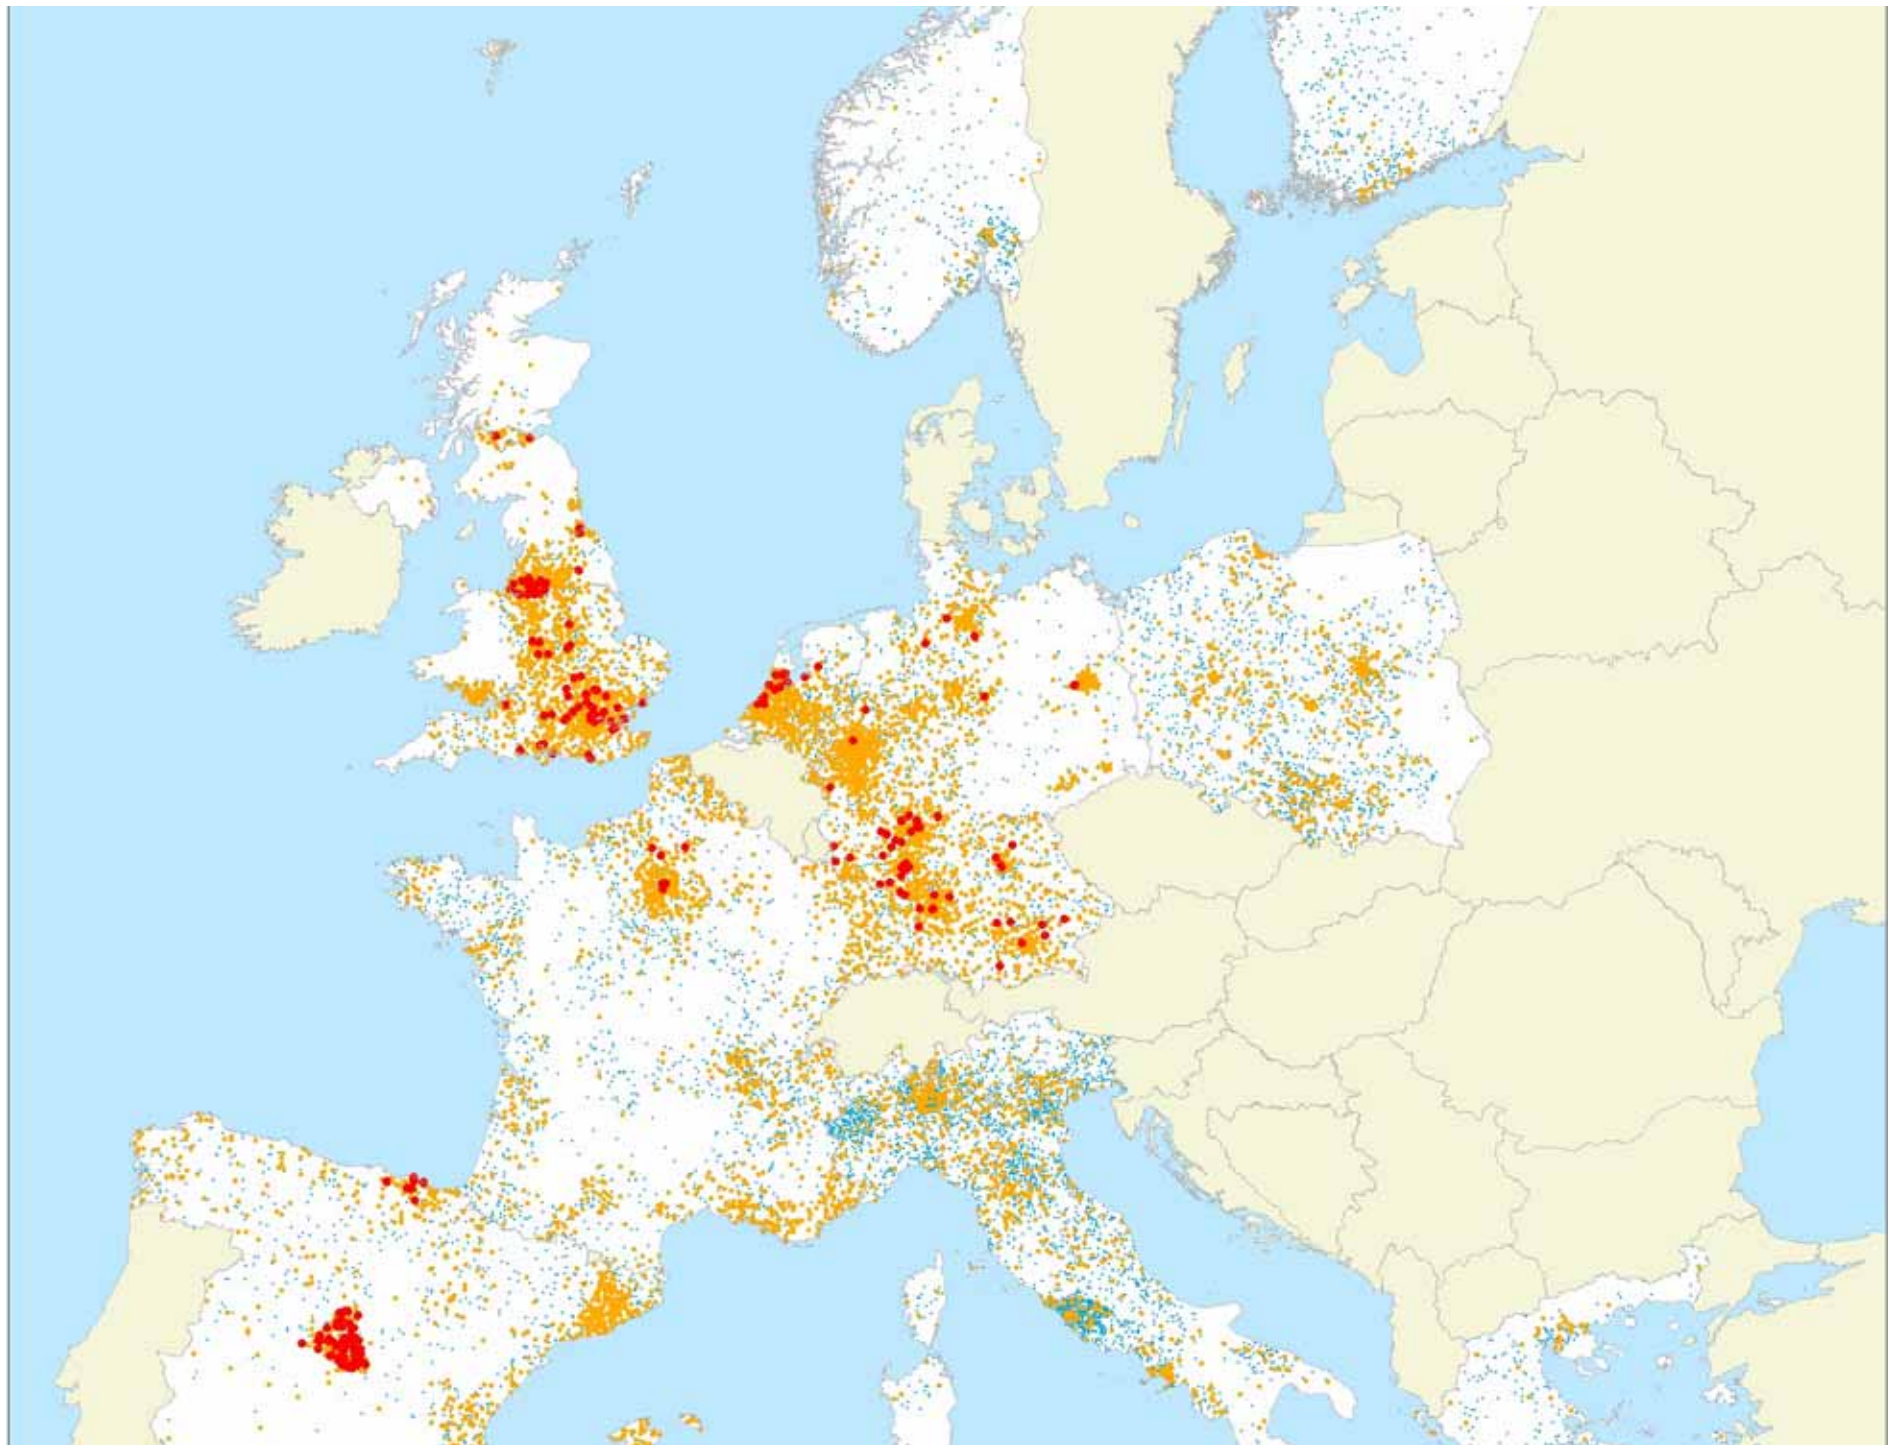

The Capital area

Suggestion to a
building sequence of
the initial H₂
infrastructure

The world is a platform for tests of new energy carriers:

Our partners in Norway have created a HyNor hydrogen highway that is about to be extended into Sweden and Denmark

Hydrogen would create a paradigm shift in the development of the infrastructure of our society
(see: Sigfusson, Taming of the Proton)

On the way to a carbon free energy economy

Iceland - the first hydrogen society!

Owners:

VistOrka

DaimlerChrysler AG

Norsk Hydro ASA

Shell Hydrogen

Replacing fossil fuels with hydrogen
